The artifact I selected is my CS 360 Mobile Event-Tracking application, which was created as part of my coursework. The application allows users to create, view, edit, and manage events. I selected this artifact because it demonstrates my skills in software development, including application design, user interaction, and code organization. I improved the artifact by making the navigation and user interface easier to use, strengthening input validation, and organizing the code for better maintainability. I met the course outcomes I planned to address in Module One, and I have no major changes to my original outcome-coverage plan. During the enhancement process, I learned more about the importance of organization, usability, and maintainability. One challenge was making improvements without breaking the existing functionality. Overall, the process helped me better understand how small changes can improve both the user experience and the quality of an application.
